

Manager's Log Monday, April 27 2020

What is this week six of the pandemic and we have policies in place. And now we have face masks highly recommended, mandated in Humboldt County, out in public. Well, it makes sense. It kind of prevents the spread and that's what you call flattening the curve. And so far so good here, we only have one confirmed report to the base camp reports that we get from OES.

It has only been that one incident of someone in our local area don't know who, and that's fine. But just one report that was served service by Kimaw. So that could be anybody, you know Kimaw operates wide range. Not just in the valley, outside of the valley as well. Humboldt County, well, operate all parts of Humboldt County, but I think they defer any incidences reported of Kimaw as not in Humboldt County. So we had one for our little local area, as opposed to 50 from the populations much bigger, five times bigger.

Anyway, we seem to be on a trend of recovery, but we still have and that may be because we have been doing very well in how we are protecting one another, as well as ourselves. Washing hands, social distancing, wearing masks in public, all add up to safety.

You guys know, these little viruses, it would really be healthful if viruses and and toxic elements in the air were color coded. Then you can see em, you know when you have an a nice clear day well that means there's no viruses and no Carcinogens in the air. Cool, I like that. But as they show up and get a billion of them, mozillian of them they start to make the day look a little hazier. And which is what happens when we have forest fires. Just a hazy day means the air quality is not that good. We can see that. But viruses, no. It'll be helpful if they're color coded. We could see where they're layin, What type of them.

A little imagination on a Monday. So stay well. Take care. Thank you for listening.
